

Step1: Understanding Purpose and Audience

The primary goal of the website is to showcase personal achievements, skills, and projects to various audiences, including professors, classmates, future employers, and colleagues.

Step2: Information Architecture (IA):

The website was structured around five main pages: Homepage, Gallery, Resume, Contact, and News (time-based page), with each page addressing a specific aspect of the content.

Every page will have a NavBar and footer for navigation to other pages. I also plan to add a “Let’s Talk” button on the NavBar. On the homepage, the “Home” button will use a dropdown menu to allow users to locate specific sections quickly.

Step3: Design each page

Home Page:

- Included a brief self-introduction, internship experiences, skills section and contact me:
 - Self-introduction: A brief self-introduction with a "More About Me" button that links to Gallery page.

- Internship experiences: Using a carousel template to showcase three internship experiences. The carousel enables users to view multiple experiences in one location without overwhelming the page.
- Skills Section: Using cards template to categorize skills into technical, professional, and interpersonal domains. Make it clean and organized.
- Contact Section: Summarizes the contact information and invites users to connect.

Gallery Page:

- Showcases photography and videography projects using a waterfall layout.

Resume Page:

- Using grid template to organize content
 - Left section: Includes a profile picture and a short information of myself.
 - Right section: Divided content into profile, internship experiences, project highlights, skills (using progress bars to make proficiency levels clear and visual), and personal interests. Also using typography by choose varying font size and styles for titles, subtitles and body text.

Contact Page:

- Using a table template to display personal contact details.
- Display validation feedback using a styled tooltip, which will be clear and visually.

News Page (Time-Based Page):

- Using card template to display 5 different news in chronological timeline. Each news included title, publication dates, and subtitle. Also, includes a “Read Full Article” button linking to the original source (CBC).

Step4: Making wireframes

Using Figma to draw wireframes for each page, and included desktop and mobile. (The exported wireframes added at the end of pdf)

Desktop Wireframes

Frame 2

Frame 7

Frame 8

Frame 9

Frame 10

Step5: Adding design elements

After completing the wireframes, I will proceed with adding specific design elements. This including select colors (pink and white) and font styles, as well as choose images, videos and icons (Using Font Awesome).

Step6: Coding using Dw (html and css)

Implemented using Bootstrap to ensure a responsive design across different devices, and include all necessary Bootstrap components.

Step7: Refining Details

After completing the coding, I tested the website on Safari and Google Chrome browsers to ensure compatibility and responsiveness. Also, improve some of alignment, aesthetics and functionality.

Usability and accessibility principles

For usability principles, the navigation structure (Gallery, Resume, Contact, and a time-based News page) was simple and clear, which allow user to quickly find the information they need. The homepage includes a dropdown design for user access section easily. Additionally, on the top-right corner provides a “Let’s Talk” button, which make users to quick access to contact information. Also, the background and font colors are consistent between all pages, as well as the navigation bar and footer, in order to ensure the cohesive user experience. The homepage pages is divided into distinct content areas such as About me, Internship experience, each have clearly

labeled with headings. For Dynamic elements, the project included carousels and local videos, which add interactivity and effectively capture user's attention.

For accessibility principles

Perceivable:

- I use light pink background color with dark text, creating a strong visual contrast to ensure readability, even for users with visual impairments.
- All images and videos include descriptive alt attributes, which provide meaningful descriptions for visually impaired users.
- Using responsive design, allowing users to access page without content distortion or loss information.
- When users click on or hover the button, the button will provides feedback immediate by changing background color.

Operable:

- Include navigation NavBar (Home, Gallery, Resume, Contact, and News). The Home section includes a dropdown menu for access to subsections (About Me, Internship Experience, Skills) easily.
- Interactive elements like buttons (e.g., "More about me") and carousel slides include ARIA labels to help users navigate and interact with the site.
- The "Contact Me" page have validation features and tooltips, allowing users to input data accurately. Tooltips will activate when user hover over or click the button.

Understandable:

- The website uses simple and clear language, making it accessible to a broad audience.

Information is presented in well-structured sections (e.g., cards for skills, tables for contact details).

- In resume section have some icons, in order to visually distinguish each subsection (e.g., profile, internships, projects), which improve clarity and help users quickly understand content.
- Themes (color) and fonts are keep same across all the pages, ensure unified experience.

Robust:

- The website is designed responsively, make sure usability on various devices, including desktops, tablets, and smartphones.
- It is compatible with commonly used browsers, such as Google Chrome and Safari which ensure accessibility for the majority of users.

Small Responsive Design Breakpoints

- **For screens smaller than 900px:** Firstly, for gallery layout, the grid column count reduces from 3 to 2, in order to maintain balanced layout and ensure images and videos are not overcrowded. Also, for navigation bar the menu collapses into toggle button on the right to suit smaller screens.
- **For screens smaller than 600px:** For gallery layout, the grid column count reduces from 2 to 1. Addition, hero section the text and images are centred, with the image width adjust into 70% to avoid overflow.
- **For screen smaller than 1024px:** For homepage section like “About Me” is limited to 75%. Also, the homepage the layout ensures skills cards and carousel items remain proportionate.
